ENCRYPTION & EXPORT COMPLIANCE DECLARATION

Application: D-Ticket zu Apple Wallet (de.dticket.wallet)
Version: 1.1.0 | Platform: iOS 17+
Developer: Fynn Hicken (fynn.hicken@gmail.com)
Date: November 3, 2026

1. REGULATORY EXPORT COMPLIANCE STATUS (U.S. EAR)
The application qualifies for export exemption under U.S. Export Administration Regulations (EAR) Category 5, Part 2, Note 4 and 15 CFR § 740.17(b)(1).
Note 4 specifically exempts products where cryptography is strictly used for "Authentication, digital signature, or data integrity".
Non-Exempt Encryption: None (ITSAppUsesNonExemptEncryption = false).

2. PURPOSE OF CRYPTOGRAPHY
The application is a 100% offline on-device utility converting transit ticket barcodes into Apple Wallet passes (.pkpass).
Under Apple Inc.'s mandatory PassKit Package Specification, every .pkpass file must contain a detached CMS / PKCS#7 signature file that authenticates the pass package manifest.
No user data encryption, communication confidentiality, or surveillance encryption is performed.

3. ALGORITHMS & IMPLEMENTATION DETAILS
- Digital Signature: RSA 2048-bit with SHA-256 (RFC 5652 CMS / PKCS#7 standard)
- Digest Computation: SHA-256 (CryptoKit.SHA256)
- PassKit Manifest Hash: SHA-1 (required by Apple PassKit specification)
- Certificate Import: In-memory PKCS#12 decoding via Apple Security framework

4. NATIVE OPERATING SYSTEM FRAMEWORKS ONLY
All cryptographic operations are executed strictly through native iOS system frameworks:
- Security.framework (Apple iOS native API)
- CryptoKit.framework (Apple iOS native API)
No third-party, open-source (e.g. OpenSSL), or proprietary encryption libraries are used.

5. FRENCH DECLARATION (ANSSI)
Under French decree n° 2011-1436, cryptography restricted solely to digital signatures and integrity is exempt from prior authorization.
